Wed, 5:30PM-6:30PM

Project Title: Neighborhood Discovery App for Local Events, Venues, and Artists

Project Category: Software Development | Mobile & Web Applications | UX/UI Design | Digital Platforms & Community Engagement

Project Overview: This externship project supports the development of a location-based discovery application that allows users to log in and view real-time events and experiences happening in their neighborhood or while traveling. The platform aggregates venues, artists, and activities such as live music, paint-and-sip events, farmers markets, and more—combining features inspired by Apartments.com, OpenTable, and Eventbrite.
The project founder has established foundational elements, including a storyboard, website, and stakeholder vision, but seeks student support in technical layout, system architecture, and programming, which are critical to bringing the application to life.

Key Objectives:
By the end of the externship, students will:
• Translate product vision and storyboards into functional technical requirements.
• Design application architecture for a scalable, location-based discovery platform.
• Develop or prototype core features such as user login, location awareness, and event listings.
• Apply programming skills to front-end, back-end, or full-stack development tasks.
• Bridge the gap between concept and execution by supporting a non-technical founder.
Scope of Work;
1. Product & Technical Planning
• Review existing storyboards, website, and stakeholder goals
• Define user flows and feature requirements
• Assist in selecting appropriate technologies or frameworks
2. Application Architecture & Layout
• Design system structure for mobile and/or web deployment
• Plan databases for venues, events, artists, and user accounts
• Consider scalability, performance, and data integration
3. Programming & Development
• Develop front-end components (UI/UX implementation)
• Support back-end logic, APIs, and data handling

• Integrate location-based services and filtering
4. User Experience & Design
• Ensure intuitive navigation and discovery
• Align technical layout with visual and experiential goals
• Test usability across different user scenarios (local vs. visitor)
5. Collaboration & Iteration
• Work closely with the founder and stakeholders
• Participate in feedback cycles and iterative improvements
• Document technical decisions and workflows"
